

ABSTRACT OF THE DISCLOSURE

A system for managing a plurality of managed servers that each execute a server agent includes a client computer having an interface for selecting a service to manage and one or more of the managed servers. The system further includes an agent manager coupled to the client computer. The agent manager requests a file from the selected managed servers that correspond to the first service, receives a modified file from the client computer and instructs the server agents that correspond to the selected managed servers to perform file modifications based on the modified file.
